

# ANALYSIS OF EXISTING TYPES OF MOBILITY

**IO2** consists of an “analysis of different types of virtual and blended mobility and their technical conditions”.

The focus is on the conditions of implementation of different mobility schemes. The aim is to better understand what already exists at institutional level and, second, to experiment a scenario of virtual mobility.

This intellectual output also provides a better understanding of the technical and practical requirements of virtual/blended mobility (videoconference facilities, computers, software) and of the need for trained staff in order to implement new forms of teaching.

1. Two surveys have been conducted among the universities of the consortium: the first one on mobility practices (regarding physical, virtual and blended mobility) and the second one on the identification of core scientific areas for virtual and blended mobility. The findings of these surveys are gathered in a report:

Desk Research Report*. Porto: Universidade do Porto - Núcleo de Tecnologias Educativas; Serviço de Relações Internacionais.

2. The design and implementation of a shared online course was organised by three universities of the consortium: UMarburg, UPorto and UVSQ. The theme of this online

course was travel literature. Two reports have been prepared on the experience:

- The first report focuses on the organisation, development and progress of the online course (including reference to pedagogical material used in and around the course).

- The second report consists of an analysis of the feedback received from teachers and students on the online course.

3. Based on the previous findings, a handbook of good practices has been prepared.
